Care of Shave Biopsy Site

Directions: Keep the biopsy site dry overnight. Remove the band-aid or dressing the following day and gently clean the area with soap and water (may be done while taking a shower or bath). Carefully remove any crusted material within the wound. Apply Bacitracin or Polysporin ointment twice daily until healed. A band-aid or dressing need not be reapplied unless the wound is oozing, irritated or if you are concerned about the appearance. For mild to moderate discomfort, we recommend Tylenol (1-2 tablets every 6 hours).

Normal Findings: Redness and slight tenderness around the operative site for a few days are normal. Formation of a white to light green film in the operative site is normal, but removal is advisable to prevent a delay in healing time. Hydrogen peroxide, diluted half-strength with water, rolled over the wound with a Q-Tip can help lift crust off the wound.

Abnormal Findings: If the area: becomes progressively more tender, swells markedly, begins to drain with pus or blood, is dark red color around the site, warm to the touch, or a fever of ≥ 100 F develops, contact our office at 406.586.7873. If after normal office hours, you may contact Dr. Mann at 406.581.7482.

We will contact you within 7-10 days with the pathology results.
